Assymmetric Spinnaker Deployment Suggestions

The diagram above is for guidance in setting the asymmetric spinnaker of your catamaran.

The sheeting blocks are strap head and can be made down to the aft cleats.

The tack of the sail is secured by a rope bridle. The bridle may be fitted with a snap shackle tied at center. The bridle is made down to the bow cleats

The sheets are handled by the genoa winches.

To jibe, the windward sheet is released to let the clew blow around forward and effectively invert the sail when the wind comes through astern. The previously slack leeward sheet now becomes the windward and can be taken up as desired.
